                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                    The present sequence represents a UDP-N-acetylmuramate:L-alanine ligase (C) (MurC polypeptide) encoded by the S. aureus MurC gene. Host cells containing an expression system comprising the MurC gene can be used for the recombinant production of the polypeptide. Agonists or the MurC polypeptide are used to treat conditions requiring increased activity or expression of the polypeptide. Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide acid or competitive polypeptide are useful for inhibiting the polypeptide early services. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The incobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The MurC polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising antibodies; to identify modulators or specific receptors; in rational cruseful in antisense/ribozyme therapeutics; to detect mutant MurC gene; are useful in antisense/ribozyme therapeutics; to detect mutant MurC gene;
                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a protein from Streptococcus pneumoniae.

C. The nucleic acid sequence encoding the Streptococcus pneumoniae protein can be useful in vaccines for inducing protective antibodies against commoniae, for treatment or prevention of infection e.g. pneumonia, otitis media or meningitis. Probes based on the nucleic acid care used to detect Streptococcus infection (by usual hybridisation or camplification methods), also for isolating Streptococcus genes or their callelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive cimmunisation (optionally coupled to a toxin). Vaccines are administered, ce.g. by injection, orally or through the skin, typically at 0.01-1000 (especially 10-300) mu g/ml per dose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

This sequence represents a Staphylococcus aureus protein of unknown function, and is encoded by a DNA sequence of the invention.

The DNA sequences were isolated from Staphylococcus aureus WCHU29

(NCIMB 40771). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides.

Conditions which may be treated include bacterial infections, especially respiratory, cardiac, gastrointestinal, central nervous, eye, kidney, urinary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      involved in outer membrane or cell wall biosynthesis.

(The protein may be used in a vaccine to prevent or treat

H. pylori infection or to identify H. pylori polypeptide binding

compounds, useful as potential H. pylori life cycle activators or

inhibitors. The genomic sequence of H. pylori (ATCC 55679) was

determined from overlapping contigs generated by mechanically

shearing the bacterial DNA. The sequences were analysed for ORF of

at least 180 nucleotides, and the predicted coding regions defined

by computer evaluation. To identify likely H. pylori antigens for

vaccine development, the amino acid sequences predicted from

covarious ORF were analysed for significant homology to other known

or exported membrane proteins. Having identified and determined

to sequences of interest, particular regions can be isolated from

u maint her now manificant for recombinant columns to

                                                             Helicobacter pylori nucleic acid sequences and related proteins used for diagnostics and therapeutics claim 18; Page 131; 235p; English.

This sequence represents an H. pylori cytoplasmic protein involved in outer membrane or cell wall biosynthesis. This sequence showed homology to N-acetylmuramate-Alanine ligase.

Helicobacter pylori has been strongly linked to chronic gastritis and duodenal ulcer disease. The nucleic acid sequences of the invention are used to evaluate compounds, especially activators or inhibitors of bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequence. The nucleic acid sequence is a corresponding proteins, are
                                                                                                                                                                                                                                                                                                                                                            29-MAY-1997.

polypeptide(s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter Claim 61; Page 335; 1481pp; English.

This sequence represents a H. pylori cytoplasmic protein involved in outer membrane or cell wall biosynthesis.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To

H. pylori whole genomic DNA was isolated and nebulised to a median size of 2000 bp. Purified DNA fragments were blunt-ended and ligated to unique BstXI-linker adapters in 100-1000 fold molar excess. These linkers are complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The linker-adapter inserts were ligated to each of the 20 pMPX vectors to construct a series of shotgun subclone libraries. The purified DNA samples were then
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 W20102;

                                                     PT Nucleic acid encoding antigenic peptide(s) from Streptococcus
proper protective or their epitope-containing fragments, useful in
protective or therapeutic vaccines, and for diagnosis
Claim 11; Page-72; 118pp; English.

The present sequence represents a protein from Streptococcus pneumoniae.
The nucleic acid sequence encoding the Streptococcus pneumoniae protein
can be useful in vaccines for inducing protective antibodies against
Streptococcus pneumoniae, for treatment or prevention of infection e.g.
pneumonia, otitis media or meningitis. Probes based on the nucleic acid
are used to detect Streptococcus infection (by usual hybridisation or
amplification methods), also for isolating Streptococcus genes or their
allelic variants. The protein can be used similarly to detect specific
monitoring infections. Antibodies which bind the protein are used to
detect corresponding antigens, to purify the protein and for passive
immunisation (optionally coupled to a toxin). Vaccines are administered,
e.g. by injection, orally or through the skin, typically at 0.01-1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

                                                                                                                                                                                                                                  Streptococcus pneumoniae mur D biosynthetic gene - which encodes uridine-diphosphate-N-acetylmuramyl-L-alanyl-D-isoglutamate ligase, useful for identifying antibacterial compounds Claim 1; Column 13-16; 14pp; English.

This is the amino acid sequence of the Streptococcus pneumoniae murD biosynthesis protein. The murD gene encodes the enzyme uridine-diphosphate-N-acetylmuramyl-L-alanyl-D-isoglutamate ligase. The nucleic acid can be used for the production of recombinant MurD protein and the implementation of large scale screens to identify new antibacterial compounds targeted at the stem peptide biosynthetic pathway involved in the synthesis of the bacterial cell wall. Structural analysis of the MurD protein will enable structure-based drug design to develop novel compounds for the treatment of antibiotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               drug design; resistance;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents Streptococcus pneumoniae MurD protein (uridine-diphosphate-N-acetylmuramyl-L-alanyl-D-isoglitamate ligase). The MurD protein is useful in a method for identifying compounds that inhibit Streptococcus pneumoniae MurD activity. Compounds identified are potentially useful as antibacterial agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              drug screening

One clone contained a 6.85 kb insert including the genomic sequence T78867. The gene comprises a 1.8 kb region encoding 3 major blocks of tetrapeptide repeats (especially the amino acid sequence VEES, VEEN, VEEI, VAPS, VAPT, etc) and a 3' hydrophobic region corresponding to a glycosyl-phosphatidyl-inositol membrane anchoring sequence. The invention relates to new polypeptides of at least 10 amino acids derived from the LSA-3 protein with the exception of the peptides W24791-4. The LSA-3 peptides can be used to raise antibodies and as vaccines for immunotherapy of malaria. Sequence 1786 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Plasmodium falciparum; pre-erythrocyte; liver stage antigen; serum; prophylaxis; Thai strain; gene organisation; exon; intron; hydrophot glycosyl-phosphatidylinositol membrane anchoring sequence; antibody;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PT Helicobacter pylori nucleic acid sequences and related problement (s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter by infection, and to detect Helicobacter pylori protein of unknown places of the present sequence is a Helicobacter pylori protein of unknown control or the protein may be used in a vaccine to prevent or treat the protein may be used in a vaccine to prevent or treat the pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 5579) was compounded from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 cultivation. To identify likely H. pylori actigens for vaccine canalysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 7.0%;

Helicobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection Claims 14,94; Page 668-669; 1145pp; English.

This sequence is a H. pylori secreted protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of the pylori in a sample and the diagnosis of H. pylori infection. Nucleic

Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli

CC The present sequence is a Helicobacter pylori cell envelope protein. CC The protein may be used in a vaccine to prevent or treat H. pylori CC infection or to identify H. pylori polypeptide binding compounds. CC useful as potential H. pylori life cycle activators or inhibitors. CC The genomic sequence of H. pylori (ATCC 55679) was determined from CC overlapping contigs generated by mechanically shearing the bacterial CC and the predicted coding regions defined by computer evaluation. To CC identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant CC and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide Sequence 432 AA;

MPsrch\_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Wed Nov 24 00:53:33 1999; MasPar time 4.20 Seconds 610.175 Million cell updates/sec

Tabular output not generated.

Title: >US-09-103-287-4

Description: Perfect Score: (1-215) from US09103287.pep 1495

Sequence: 1 FKDSDDIYAQIFQITDKGTA......GDIQKLQNAYLDKLGMKNAF 215

Scoring table: PAM 150 Gap 11

Searched:

122461 seqs, 11912985 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-issued 1:5A\_COMB 2:5B\_COMB 3:PCT9\_COMB 4:backfiles1

Statistics: Mean 29.592; Variance 156.427; scale 0.189

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
